JOIN US FOR A REASONING-EVENING DISCUSSION:

Gerrymandering

How can you consistently control which party has a majority in a legislature? If you get to draw the boundaries for the districts, you can often give your party an advantage. Such specially designed districts are called gerrymanders. At this Reasoning Evening, we'll talk about how gerrymandering works and how to apply mathematical concepts to decide when legislative districts are fairly drawn. Prof. Johanna Franklin (Math) will lead the discussion.

Join students and faculty from Mathematics, Philosophy, Psychology, Economics, and other departments to discuss. We’ll also eat some pizza.
